Electron Transfer Reactions of Complex Ions in Solution

By HENRY TAUBE
Department of Chemistry
Stanford University
Stanford, California

The current monograph is an expanded and updated treatment of the material presented in a series of four lectures by Professor Taube while in residence at the Institute and deals with such topics as the hydration of cations, activated complexes for electron transfer, ligand effects in electron transfer reactions, and induced electron transfer.

ORD and CD in Chemistry and Biochemistry: An Introduction

By PIERRE CRABBÉ

Syntex, S. A.
Universidad Nacional Autonoma de Mexico and
University Iberoamericana
Mexico, D. F., Mexico

CONTENTS:

Preface. Basic Principles, Definitions, and Units. ORD and CD of Organic Functional Groups. Solvent and Temperature Effects. Amides, Peptides, Nucleosides, Nucleotides, Pigments, and Porphyrins. Optically Active Polymers. Metallic Complexes. Magnetic Optical Rotatory Dispersion and Magnetic Circular Dichroism. Appendix. Problems. Table of Rules Presently Available in ORD–CD. Table of Compounds, Functional Groups, and Chromophores.

This monograph provides a basic introduction to Optical Rotatory Dispersion (ORD) and Circular Dichroism (CD) and their applications to structural and stereochemical problems. These techniques furnish precise and accurate stereochemical data quite rapidly, and they are the only ones that can be used to study chiral molecules by analyzing their Cotton effects. The book emphasizes those Cotton effects encountered in organic molecules, although ORD and CD techniques can also be applied to inorganic molecules.
